It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin I secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell proliferation and induce cell differentiation.

-! SUBURIT: Homostimer (By similarity).
-! SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. ALSO EXISTS AS AN EXTRACELLULAR SOLUBLE FORM (BY SIMILARITY).
-! PTM: THE SOLUBLE FORM DERIVES FROM THE MEMBRANE FORM BY PROTEDLYTIC PROCESSING (BY SIMILARITY).
-! DISEASE: CACHEXIA ACCOMPANIES A VARIETY OF DISEASES, INCLUDING CANCER AND INFECTION, AND IS CHARACTERIZED BY GENERAL ILL HEALTH AND MAINTENTATION.

It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin 1 secretion and is implicated in the induction of cachexia, under certain conditions it can stimulate cell proliferation and induce cell differentiation.

SUBCELULIAR LOCATION: Type II membrane protein. Also exists a extracellular soluble form (By similarity).

PTM: The soluble form derives from the membrane form by support the membrane form by the form the membrane form the membrane form the membrane form the fo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PTM: The soluble to me controlled the soluble form, is proteolytic processing (By similarity).

PTM: The membrane form, but not the soluble form, is phosphorylated on serine residues. Dephosphorylation of the phosphorylated on serine residues of the phosphorylated on serine residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SIMILARITY: BELONGS TO THE TUMOR NECROSIS FACTOR FAMILY

11- FUNCTION: Cytokine that binds to TNFRSFIA/TNFR1 and
TNFRSFIB/TNFBR. It is mainly secreted by macrophages and can induce cell death of certain tumor cell lines. It is potent pyrogen causing fever by direct action or by stimulation of interleukin I secretion and is implicated in the induction of cachexia, Under certain conditions it can stimulate cell

The peptides form pharmaceutical compositions for treating oedema, especially pulmonary oedema. The peptides are non-toxic, whilst retaining the oedema resorption-inducing capacity as TNF. The present sequence represents a specifically claimed TNF-alpha peptide from the present invention.
                                  The TNF-alpha tip peptides given in AAR60232-42 were modified with N-terminal biotin-Gly-Gly moieties and were used to demonstrate that the tip region of mouse and human TNF-alpha contains the trypanosomal and lectin-like activities of the molecule and is

                                                                                                                                                                                                                                                                                                              Query Match
                                                                                                                                                                                                                                                                                                                                                                 The present invention describes the use of peptides comprising a chain of 7-17 contiguous amino acids derived from the Ser100-Glul16 region of human tumour necrosis factor-alpha (TNF-alpha), or Ser99-Glul15 region of mouse TNF-alpha, for treating oedema. The peptides form pharmaceutical compositions for treating oedema especially pulmonary oedema. The peptides are non-toxic, whilst retaining the oedema resorption-inducing capacity as TNF. The present sequence represents a murine TNF derived peptide used in an example from the present

09-OCT-1986;
                 TNF-like polypeptides and compsns. are produced by the fermentation of host cells transformed with at least one DNA sequence which codes for a mammalian TNF-like polypeptide operatively linked to an expression control sequence in the transformed host.
Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence encodes tumor necrosis factor which is an antitumor agent and a lymphokine. The sequence may optionally have up to additional AA as the N-terminal.

A modified version of this sequence is claimed in which at least one of the channel residues is substituted (see Features Table). The resulting TNF-alpha mutein has modified channel activity compared to wild-type.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence of murine TNF-alpha disclosed in PNAS USA 83:1670-1674 (1986) is given in the specification. A modified version of this sequence is claimed in which at least one of the channel residues is substituted (see Features Table). The resulting TNF-alpha mutein has modified channel activity compared to wild-type.
                                                                                                                                                                    Misc-difference 100

(first entry)

AAP60527 standard; Protein; 157 AA

Sequence of tumour necrosis factor (TNF).

antitumour; antimalarial;

tumour necrosis factor.

03-JUL-1986. 19-DEC-1985;

85WO-EP00721.

Anticancer agent; WO8603751-A.

                                                                                                             TNF-alpha muteins were constructed in the tip region (given in AAR60231) of mouse TNF-alpha. The mutations resulted in: modulation of lectin-like activity; reduced toxic activity; modulation of inflammatory activity; modulated adhesion molecule inducing capacity; reduced metastasis promoting activity; and/or increased half-life. Muteins of the human TNF (given in AAR60243)
